

PROJECT PROPOSAL

Technician Live Tracking & Job Management System

Development Scope, Timeline & Cost Estimate

Prepared For:
Sreejith, Image Mobiles

Prepared: Focus IT Solutions, July 31, 2026
Website: <https://focus-its.com/> | Contact: 9744755587
Platforms: Web Admin (Laravel) · Flutter Technician App · Public Customer Web Page

1. Project Overview

A live-tracking job management platform for a multi-branch service company, covering branch/technician administration, job lifecycle management, real-time GPS tracking, SMS notifications, and a public customer tracking page — built on Laravel, Filament, Flutter, and Vue 3.

Platforms

- Web Admin Panel (Laravel) — Super Admin + Branch Manager roles
- Flutter Mobile App — Technician role, live GPS + job workflow
- Public Web Tracking Page (Vue 3 + Inertia) — customer, no login required

Core Capabilities

- Branch & technician management, role-based access
- Full job lifecycle: create → estimate → assign → track → additional charges → close
- Live GPS tracking via Laravel Reverb, including the two-leg shop-repair workflow
- SMS notifications at 6 trigger points (MSG91, DLT-compliant)
- Auto-generated receipts / invoices

2. User Roles

Role	Scope	Key Actions
Super Admin	All branches	Create/manage branches, create Branch Managers, view all jobs & tracking, company-wide reports
Branch Manager (Admin)	Own branch	Add/manage technicians, create jobs, assign jobs, set cost estimate, view branch tracking, branch reports
Technician	Own assigned jobs	Create job (pending estimate), start/track job, update status, add charges, upload images, close/extend
Customer	Own job only, no login	Receive SMS updates, view live tracking via web link, view/download receipt

3. Core Modules

3.1 Branch Management (Super Admin)

- Create/edit/deactivate branches — name, address, geo-location, contact
- Assign one Branch Manager per branch

3.2 Technician Management (Branch Manager)

- Add/edit/deactivate technicians under own branch
- Profile: name, phone, photo, service/skill type
- Generates login for Flutter app (phone + OTP or password — open item)

3.3 Job Management

- Create: Branch Manager or Technician — technician-created jobs sit in "Pending Estimate" until Admin sets cost
- Assign: Branch Manager/Admin assigns technician (auto-assigned to self if technician created it)

- Fields: customer name/phone/address/geo-pin, service type, description, scheduled date/time
- Additional charges: technician adds line items mid-job; running total updates and customer is notified by SMS
- Close: technician marks complete, images required, notes optional
- Extend: technician/admin pushes scheduled/completion date, job stays open
- Cancel: not in original spec — flagged as an open item, recommended to add

3.4 Live Tracking

- Technician app streams GPS while job status = Started / In Progress / Out for Delivery
- Admin panel: live map of all active technicians (Super Admin = all branches, Branch Manager = own branch)
- Customer web page: live map of their assigned technician only, via tokenized link
- Tracking pauses/stops on Close / In-Shop states

3.5 Shop-Repair Workflow (reschedule → shop → deliver)

Applies when a technician can't finish on-site and takes the item to the shop:

1. Technician sets status "Reschedule → Shop" → pickup tracking (Leg 1)
2. Item reaches shop → status "In Shop" (tracking paused, no GPS needed)
3. Repair done → technician starts Leg 2 "Out for Delivery" → new tracking session, same job
4. Customer gets a new SMS + new tracking link for the delivery leg
5. Delivered & confirmed → job closes

3.6 Customer SMS Notifications

Sent at these trigger points:

1. Job assigned → technician name/photo/phone + cost estimate + tracking link
2. Technician started job → tracking link (if not already sent)
3. Additional charge added → updated total
4. Reschedule to shop → status update
5. Out for delivery → new tracking link
6. Job completed → receipt link (view/download only)
7. All SMS notifications are transactional;

3.7 Customer Web Tracking Page (public, no login)

- Opened via unique tokenized link from SMS
- Shows: technician name/photo, live map, job status, cost estimate/current total, ETA
- Mobile-responsive (most opens happen on phone browser)
- Receipt link appears after completion

3.8 Receipt / Invoice

- Auto-generated on job close (job details, technician, cost breakdown incl. additional charges)
- View/download only — no online payment, per current scope

4. Flutter App (Technician)

- Login: phone + OTP (or password — TBD)
- Job list: assigned/today/upcoming, filter by status
- Job detail: customer info, map navigate button, estimate, status actions

- Start Job → begins live GPS tracking (background service)
- Update status: In Progress → Reschedule/Shop leg → Out for Delivery → Complete
- Add additional charge (description + amount)
- Upload images (camera/gallery, multi-select) — required to close
- Close / Extend job
- Background location: ping every 10–15 sec while job active, stop on close/pause (tuned for battery life)

5. Job Status Flow

```

Created → Pending Estimate (if tech-created) → Assigned → Started (tracking ON)
  → In Progress — (Additional charges can be added anytime here)
    |→ Completed / Closed
    |→ Extended (date pushed, stays In Progress)
    |→ Reschedule → Shop
      → Picked Up (Leg 1 tracking)
      → In Shop (tracking paused)
      → Out for Delivery (Leg 2 tracking)
      → Delivered → Completed / Closed
  
```

6. Tech Stack

Layer	Choice	Why
Backend	Laravel	Matches existing stack
Admin Web	Filament v5	Matches prior precedent, fast to build
Customer Web (public tracking)	Vue 3 + Inertia	Token-based, no login needed, lightweight
Mobile (Technician)	Flutter	Cross-platform as required
Real-time tracking	Laravel Reverb	No per-message cost, native to Laravel
Maps	Google Maps / Mapbox	Best polish; fallback for cost at scale
SMS	MSG91	India-focused, DLT-compliant, cost-effective
Database	MySQL	Standard with Laravel

DLT registration (sender ID + templates) is required before sending transactional SMS in India and has independent lead time — start early. Cost-fallback alternates: Mapbox instead of Google Maps if usage scales up; Pusher/Firebase instead of Reverb if self-hosting WebSocket becomes a hassle.

7. Cost Estimate by Phase

Phase	Days	Rate (₹/day)	Amount (₹)
1. Foundation — auth, roles, branch/tech CRUD	8	4,000	32,000
2. Job Core — CRUD, assignment, estimate, status flow	11	4,000	44,000

Phase	Days	Rate (₹/day)	Amount (₹)
3. Flutter App — login, job list/detail, image upload	15	4,000	60,000
4. Live Tracking — Reverb, GPS, admin map, customer page	15	4,000	60,000
5. Notifications — MSG91, SMS triggers, receipts	5	4,000	20,000
6. Shop-Repair Flow — Leg 1/2 tracking, in-shop pause	6	4,000	24,000
7. Testing & Launch — QA, DLT approval, deploy	12	4,000	48,000
Subtotal (Development)	72		2,88,000

8. One-Time & Recurring Setup Costs

Item	Type	Cost (INR)
DLT registration (sender ID + SMS templates)	One-time	₹5,000 – ₹10,000
Google Play Console account	One-time	~₹3,000
Apple Developer account (if iOS required)	Annual	~₹8,500/year
Server hosting (staging + production VPS)	Recurring	₹2,000 – ₹5,000/month
Domain + SSL	Annual	~₹1,500/year

Note: We can utilize your existing subdomain and servers if you already have them available.

9. Ongoing Operating Costs (Post-Launch)

Estimated monthly cost driven primarily by Maps API usage and SMS volume — scales with job volume.

Jobs/month	Google Maps	Mapbox	SMS (MSG91, approx.)
500	₹0	₹0	₹1,000 – ₹2,000
2,000	₹0	₹0	₹4,000 – ₹8,000
5,000	₹6,685	₹0	₹10,000 – ₹20,000
10,000	₹20,055	₹0	₹20,000 – ₹40,000

Note: Maps costs assume ~1 geocode + 4 map loads per job. Mapbox's larger free tier (50,000 map loads/month) keeps it free at these volumes; Google's free tier (10,000/month) is exceeded past ~2,500 jobs/month. SMS cost depends on MSG91's per-message DLT rate and number of notification triggers per job.

10. Open Items (decide before/during build)

- Job cancel flow — not in original spec, recommended to add
- Technician accept/reject on assigned job — needed, or auto-accept on assign?
- Additional charges — require customer approval before applying, or just notify?
- Technician login method — phone + OTP vs password
- Minimum images required to close a job — count?

- Multiple technicians on one job — supported, or always 1:1?

11. Assumptions & Exclusions

- Scope reflects the plan's 7 build phases as currently defined; the Open Items above are not included and would add ~2–4 person-days each if confirmed.
- Android-only technician app assumed for the cost range above; add iOS testing/review effort if both platforms are required.
- No online payment integration (receipts are view/download only, per current scope).
- Client provides MSG91 account, Google Cloud / Mapbox billing account, and Cloudflare R2 access.
- Cost estimate excludes post-launch support/maintenance retainer — to be scoped separately.

12. Quotation Acceptance

By signing below, the client accepts the scope, timeline, and cost estimates detailed in this proposal.
